

Downtime Error Code Handbook

Reference · Codes DT-00 through DT-08

Doc ID	REF-ERR-001
Version	4.1
Effective Date	2026-03-01
Owner	Manufacturing Engineering
Scope	All plants, all lines — used for downtime coding in production and MES logging

1. Purpose

This handbook is the master reference for the downtime reason codes (DT-00 through DT-08) logged against every production shift in the MES / OEE reporting system. Operators and technicians must use these codes consistently when logging stoppages so that OEE, availability, and reliability metrics remain comparable across plants.

2. Code Reference Table

Code	Description	Severity	Avg. Duration	Reference SOP / Doc
DT-00	No Fault / Running	Informational	0 min	—
DT-01	Hydraulic System Failure	Major	137 min	Hydraulic_Maintenance_SOP
DT-02	Raw Material / Feed Shortage	Major	50 min	PM_Guide (logistics escalation)
DT-03	Tooling / Die Changeover Delay	Moderate	36 min	Changeover_SOP
DT-04	Sensor / Limit Switch Fault	Minor	8 min	Electrical_Troubleshooting_SOP
DT-05	Conveyor Jam / Misfeed	Minor	11 min	Inspection_Checklist
DT-06	Calibration Drift	Moderate	20 min	Calibration_SOP
DT-07	Operator / Shift Handover Delay	Minor	12 min	Plant_Maintenance_Policy
DT-08	Spindle / Main Bearing Failure	Major	57 min	Bearing_Replacement_SOP

3. Usage Notes

- DT-00 is logged automatically by the MES when the machine is running within cycle-time tolerance; it carries no downtime.
- DT-01 (Hydraulic System Failure) has the highest average duration of any code and is concentrated on Press Line and shared hydraulic-clamp CNC stations — see Hydraulic_Maintenance_SOP.
- DT-04 (Sensor/Limit Switch Fault) is the most frequently logged code plant-wide but has the shortest average duration — see Electrical_Troubleshooting_SOP.
- DT-08 (Spindle/Bearing Failure) is less frequent than DT-04 but carries a much higher average duration and parts cost — see Bearing_Replacement_SOP.
- Any code lasting longer than 120 minutes must be filed as a formal incident report in knowledge/incidents/.
